

# ANCHOR RIGHT AUSTRALIA

## NOW Leading the World with SUPERIOR anchor Technology

**T.A.T.S Tidal Anchor Test Skid is a World's first by Anchor Right Australia. This machine not only quantifies holding power and performance of any anchor design but can reproduce accurate results time over again. Testing with a tug boat was the norm and is an age old method that produces many variables. These variables range from wind, currents, wave height, spiking of an anchor, Rhode length and throttle application. It is NOT feasible to assign a factor to all of these variables to develop a test that will test all anchor designs fairly. The T.A.T.S test all but eliminates the variables as above; producing superior anchor technology.**

**Our two new anchor designs Super Sarca and Sarca Excel have being tested for Super High Holding power accreditation. An independent testing authority; Robertsons lifting and rigging, praised this new technology; "better and more accurate anchor testing equipment was well over due." T.A.T.S also received the appraisal of the National Marine Safety Committee as an alternative and more accurate method of measuring holding power versus anchor weight.**
