

The Evolution of SARCA

The introduction of SARCA revolutionized the trailer boat and commercial industry and was first released in 1997.

Recent independent testing with the TATS machine against the World's best anchors, including copies and look alikes have proved SARCA's design is still by far the best. We have found nothing can come close to holding power versus anchor weight ratio. Our latest development has inspired us to re-name SARCA and is now known as SUPER SARCA. Super SARCA was marginally developed with the aid of TATS, as a direct result of this new technology; Super Sarca is now producing more holding power than its pre-decessor. These figures can be found on our website. SUPER SARCA is tested for super high holding power certification.

The applications of SUPER SARCA range from luxury to commercial boats such as Calypso Star. These massive vessels have to stay put as they solely rely on this boat not moving whilst carrying out maintenance on oil rig platform foundations. SARCA's versatility has revolutionized the trailer boat industry as fishermen now only have to deploy one anchor for all their anchoring needs.
